Schematic operators

## 3.1 Schematic operators

Schematic operators

Schematic operators

## Schematic operators

- ▶ Description of state variables and operators in terms of a given finite set of objects.
- ► Analogy: propositional logic vs. predicate logic
- ▶ Planners take input as schematic operators and translate them into (ground) operators. This is called grounding.

Schematic operators Schemata

### Schematic operators: example

Schematic operator drive\_car\_from\_to(x,  $y_1$ ,  $y_2$ ):

```
x \in \{\text{car1}, \text{car2}\},\ y_1 \in \{\text{Freiburg}, \text{Strasbourg}\},\ y_2 \in \{\text{Freiburg}, \text{Strasbourg}\}\ \langle in(x, y_1), in(x, y_2) \wedge \neg in(x, y_1) \rangle
```

corresponds to the operators

```
\begin{split} &\langle \textit{in}(\mathsf{car1},\mathsf{Freiburg}), \textit{in}(\mathsf{car1},\mathsf{Strasbourg}) \land \neg \textit{in}(\mathsf{car1},\mathsf{Freiburg}) \rangle, \\ &\langle \textit{in}(\mathsf{car1},\mathsf{Strasbourg}), \textit{in}(\mathsf{car1},\mathsf{Freiburg}) \land \neg \textit{in}(\mathsf{car1},\mathsf{Strasbourg}) \rangle, \\ &\langle \textit{in}(\mathsf{car2},\mathsf{Freiburg}), \textit{in}(\mathsf{car2},\mathsf{Strasbourg}) \land \neg \textit{in}(\mathsf{car2},\mathsf{Freiburg}) \rangle, \\ &\langle \textit{in}(\mathsf{car2},\mathsf{Strasbourg}), \textit{in}(\mathsf{car2},\mathsf{Freiburg}) \land \neg \textit{in}(\mathsf{car2},\mathsf{Strasbourg}) \rangle, \end{split}
```

plus four operators that are never applicable (inconsistent change set!) and can be ignored, like

```
\langle in(car1, Freiburg), in(car1, Freiburg) \land \neg in(car1, Freiburg) \rangle.
```

PDDL

#### **3.2 PDDL**

- Overview
- Domain files
- Problem files
- Example

Schematic operators Schema

# Schematic operators: quantification

### Existential quantification (for formulae only)

Finite disjunctions  $\varphi(a_1) \vee \cdots \vee \varphi(a_n)$  represented as  $\exists x \in \{a_1, \ldots, a_n\} : \varphi(x)$ .

#### Universal quantification (for formulae and effects)

Finite conjunctions  $\varphi(a_1) \wedge \cdots \wedge \varphi(a_n)$  represented as  $\forall x \in \{a_1, \dots, a_n\} : \varphi(x)$ .

#### Example

 $\exists x \in \{A, B, C\} : in(x, Freiburg) \text{ is a short-hand for } in(A, Freiburg) \lor in(B, Freiburg) \lor in(C, Freiburg).$

PDDL Overvi

### PDDL: the Planning Domain Definition Language

- used by almost all implemented systems for deterministic planning
- ► supports a language comparable to what we have defined above (including schematic operators and quantification)
- syntax inspired by the Lisp programming language: e.g. prefix notation for formulae

```
(and (or (on A B) (on A C))
(or (on B A) (on B C))
(or (on C A) (on A B)))
```

#### PDDI: domain files

A domain file consists of

- (define (domain DOMAINNAME)
- ▶ a :requirements definition (use :strips :typing by default)
- definitions of types (each parameter has a type)
- ▶ definitions of predicates
- definitions of operators

Nebel, R. Mattmüller (Universität Freiburg)

# Example: blocks world (with hand) in PDDL

Note: Unlike in the previous chapter, here we use a variant of the blocks world domain with an explicitly modeled gripper/hand.

```
(define (domain BLOCKS)
 (:requirements :strips :typing)
 (:types block)
 (:predicates (on ?x - block ?y - block)
               (ontable ?x - block)
               (clear ?x - block)
               (handempty)
               (holding ?x - block)
```

PDDL Domain files

### PDDL: operator definition

- ► (:action OPERATORNAME
- ▶ list of parameters: (?x type1 ?y type2 ?z type3)
- precondition: a formula

```
<schematic-state-var>
(and <formula> ... <formula>)
(or <formula> ... <formula>)
(not <formula>)
(forall (?x1 - type1 ... ?xn - typen) <formula>)
(exists (?x1 - type1 ... ?xn - typen) <formula>)
```

Note: Pyperplan only supports atoms and conjunctions of atoms.

PDDL Domain files

effect:

```
<schematic-state-var>
(not <schematic-state-var>)
(and <effect> ... <effect>)
(when <formula> <effect>)
(forall (?x1 - type1 ... ?xn - typen) <effect>)
```

Note: Pyperplan only supports literals and conjunctions of literals.

12 / 23

```
PDDL Problem files
```

# PDDL: problem files

A problem file consists of

- ▶ (define (problem PROBLEMNAME)
- ▶ declaration of which domain is needed for this problem
- definitions of objects belonging to each type
- definition of the initial state (list of state variables initially true)
- ▶ definition of goal states (a formula like operator precondition)
